Bilateral lymph node metastases in the neck from uncertain primary in the nasal vestibulum

*Jurek Olszewski, Jarosław Miłośki*

## **Summary**

A squamous cell carcinoma of the nasal vestibulum is rare variant of skin cancer and constitutes only 7% of malignant tumors of the nasal cavity. Authors presents a case of neck lymph node metastases from primary site (nose vestibulum) which was completely surgical excision 3 months before. When another primary site of cancer were non confirmed selective neck dissection and adjuvant radiotherapy was performed.
