Endovascular and surgical associated treatment of post-traumatic epistaxis

***Bogdan Rydzewski, Robert Juszkat, Monika Matusiak, Małgorzata Anna Zarzecka***

## **Summary**

We report on two cases of patients, in whom endovascular embolization of the maxillary artery and next surgical ligation of the anterior ethmoidal artery was performed due to posttraumatic intracranial epistaxis. In those patients, conservative treatment failed, hence endovascular embolization was made. Due to persisted bleeding, right anterior ethmoidal artery were surgically ligated in both patients. After the procedures, bleeding completely stopped.
