SUMMARY

The authors present 68 cases of revision stapes surgery on otosclerosis. The review analyzed intraoperative findings and postrevision hearing results. According to our observations, the most common causes of failure after the first operation were: fibrous adhesions, dislocated prosthesis. Postoperative hearing improvement was achieved in 69.1% cases. The results obtained by revision are poorer than can be obtained by the primary procedures.

Key words: otosclerosis, surgical, revision surgery

Hasła indeksowe: otosleroz, leczenie operacyjne, stapidotomia, reoperacja.
