Treatment of visceral cranium bone fractures of osteosynthesis plat, complication results

Mieczysław Sulikowski, Robert Kowalczyk, Piotr Zawodny

Summary

In the recent years osteosynthesis plate has become very popular due to its quality during treatment of visceral cranium bone fractures. It is recommended to be used for stable fusion of multi segment fractures. In the Maxillo - Facial Surgery Clinic of PMA Szczecin the presented method is applied from the half since 80-ies of the last century. Experience and obtained results permit as to state that osteosynthesis plate of visceral cranium posttraumatic fractures provides most efficient method in their treatment. It allows to establish one-time anatomical functional bone fusion, soon returne to correct stomatographic system, shortens hospitalizations time, thus securing speedy returne to normal life. Analyzing the complications it was found out that in the majority of cases the decisive significance referred to: the condition of patients, time of reporting after trauma, biomechanical fusion features as well as skill of the operator. Not always the complications were the results of the applied method.
