

Dysplazja włóknista szczęki u 8-letniego dziecka. Opis przypadku
Fibrous dysplasia in 8 years child. Case report

Andrzej Skorek, Czesław Stankiewicz, Dariusz Babiński, Ewa Iżycka-Świeszewska

Summary

The authors described fibrous dysplasia in 8 years old boy with inferior orbit wall destruction and with penetration of the lesion inside the orbit. Surgery with facial degloving approach was performed. Well therapeutic and cosmetic out-come was achieved. Usefulness of imaging data, especially CT, in diagnostic procedure was stressed. The review of con-temporary literature on fibrous dysplasia was discussed.
