

Niezwykły przypadek ciała obcego ślinianki przyusznej

An unusual parotid gland foreign body

Grzegorz Namysłowski, Wojciech Ścierański, Aleksandra Polok, Natalia Urbaniec, Piotr Urbaniec

Summary

A foreign body in the parotid gland is extremely uncommon. It can penetrate to the parotid gland through the skin or from the oral cavity via the Stenonís duct. A case of 23-years-old man with the several pieces of glass within the super-ficial lobe of the right parotid gland was described. The surgical removal was performed and the diagnosis of the foreign body was quite easy.
